The imageheight variable is not being passed through the XSLT. Looking at std.data_fields.xsl the imageheight variable is spelt 'iamgegeight'.

```
<xsl:when test="$item/@control='image_hyperlink'">
  <!-- display this as a hyperlink around an image -->
  <xsl:call-template name="hyperlink">
  <xsl:with-param name="item"        select="$item"/>
  <xsl:with-param name="image"       select="$item/@image"/>
  <xsl:with-param name="imagewidth"  select="$item/@imagewidth"/>
  <xsl:with-param name="imageheight" select="$item/@imagegeight"/>
  </xsl:call-template>
</xsl:when>
```

Cheers,

Kyle Brost

Whoops! My fingers were obviously operating in a different time zone to my brain. That will be fixed in today's release.
