This should not be happening. The ENQUIRE1 task should terminate with an error if the \$where string does not contain values for the primary key. That is what line 64 in std.enquire1.inc means when it says

```
// check that primary key is complete
```

```
$dbobject->checkPrimaryKey = true;
```

You will have to step through with your debugger to see what is being passed in the \$where string and what is happening to it.
