This version contains the following updates:

updated 'include.session.inc' to include the `getPreviousPattern()` function.

updated 'std.table.class.inc' to include `$this->scriptPrevious()` method which will call `$this->commit()` if there is a database transaction which is open.

updated 'std.table.class.inc' to include `$this->no_duplicate_error` which, if set to TRUE, will prevent an error message when inserting a record which already exists. Instead it will set `$this->numrows` to zero to signify 'no insert', and the `_cm_post_insertRecord()` method will not be called. If the new record is not a duplicate then `$this->numrows` will be set to 1 to signify 'record inserted'.

updated `batch_log(filepicker)` task so that by default each file hyperlink will open up in the browser window. If 'download=TRUE' is entered into the task's settings field then each hyperlink will be processed by the `batch_log(filedownload)` task.

updated 'std.table.class.inc' to include the `post_fileUpload()` and `_cm_post_fileUpload()` methods.

updated 'std.fileupload1.inc' to call the `post_fileUpload()` method so that the file may be processed after it has been uploaded.

updated the 'selections' area of the navigation bar so that a selection can be locked, which will enable the same records to be automatically reselected when returning to the screen.

modified the processing of the `rdcaccount_id` field so that it is qualified with the table name when included in any SQL statement that is generated by the framework.
