## Subject: Icon Support

Posted by ljkbrost on Wed, 26 Jul 2006 02:37:16 GMT

I was looking at the std.datafield.xsl file and noticed that there is an ICON control type but there is no mapping for this in the framework. I was wonder what the intended purpose of the icon is?

I ask because I'm wanting to create a list view with "hot key buttons" so that each line that contains a record has an update/delete/do something action on the same line so that I don't have to select the record and then click the buttons in the nav bar.

Something like the following link where the two green buttons on the left side will initiate an action if clicked.

I looked at overloading the fieldspec to include controls for the hyperlink that would automatically reference a intermediate script that would re-route the request with the key encoded as a "get" parameter. But... I don't like the security weakness as well as the monkey work I need to keep the page navigation correct.

Is this feature in the system some where?
