Thanks and I'll give that a try now.

I can confirm that \$selection is now available in `_cm_post_search` with the new files.

Regarding the return to the LIST2 and the data being filtered it's occurred to me that this is probably because I am now using a SEARCH task rather than an ADD task (rather than the use of `append2ScriptSequence()`.)

I'll use `scriptNext()` because I prefer being able to action subsequent output tasks, but if I am correct, what would I need to do to remove any filtering on return to the LIST2?
