
Subject: problem with updateRecord()

I have the following code in the `_cm_post_insertRecord()` function. I want to change values in a parent table after inserting an additional occurrence in the child table. But the values aren't updated with `$dbobject->updateRecord ($data)`;

```
function _cm_post_insertRecord ($rowdata)
// perform custom processing before database record is inserted.
// if anything is placed in $this->errors the insert will be terminated.
{
    // verfÃ¼gbare (+1), belegte (+1) und freie PlÃtze (-1) werden aktualisiert
    // get contents of foreign table SPIELE_TRANSPORT
$dbobject =& RDCsingleton::getInstance('spiele_transport'); // Instanz fÃ¼r Lookup-Tabelle
$where = "verbaende_art_id='{ $rowdata['verbaende_art_id']}' AND
verbaende_kuerzel='{ $rowdata['verbaende_kuerzel']}' AND
vereine_kuerzel='{ $rowdata['vereine_kuerzel']}' AND
saison_id='{ $rowdata['saison_id']}' AND
mannschaften_id='{ $rowdata['mannschaften_id']}' AND
spiel_seq_no='{ $rowdata['spiel_seq_no']}' AND
transport_no='{ $rowdata['transport_no']}';

$data = $dbobject->getData ($where);

if (!empty($data)){
    $data = $data[0];
    $data['transport_plaetze_belegt'] += 1;
    $data['transport_plaetze_frei'] -= 1;
    $dbobject->updateRecord ($data);
} // if

return $rowdata;

} // _cm_post_insertRecord
```

I know that in the `std.tbl.class.inc` the function `updateRecord()` comes with `$fieldarray`. But I don't know how to handle it.

What is wrong with my code?

Many Thanks in advance.
