Hi Tony,

I am not sure where I should post this.

1. Where do you store your port information for 3306? If I have more than one mysql installation how does your code know which one to connect to?
2. Do you know of a way in order not to hardcode the values of:  
\$GLOBALS['dbusername'], \$GLOBALS['dbuserpass'] ? Its quite a big security risk because one these user names will have access to many databases.  
Will appreciate any suggestions.
