Dear Tony,

I have calendar data that must be loaded into a scheduler for display.  
I must get the calendar data from the current day and one year into the future.

The following query works with MySql 5.6:

```
select * from calendar where dt between curdate() and curdate() + interval 365 day;
```

When I run the same query through Radicore 2.04.1, I get the following error:

```
sys0060  
sys0061  
2017-07-18 01:10:46  
sys0063 Cannot extract token from: '+ interval 365 day' (# 256)  
sys0065 7678 C:\xampp\htdocs\****\includes_erp\include.library.inc  
sys0066 /****/calendar.php  
sys0187 C:\xampp\htdocs\****  
sys0183 ::1  
sys0184 localhost  
sys0185 localhost  
sys0068 ::1
```

If I remove the + from the query, I can move forward (with a correctly reported ill-formed sql query error).

It seems that there is a bug in the regex portion of the code.  
Or I have missed something silly.

Thank you for your time.

`Laevus
