Yes, of course, that explains why the problem with the missing \$schema went away.

I've replaced \$dbhost by \$server in the check and corrected another bug (see enclosed patch) and now the behaviour is as before: when importing databases, _loadDatabases() is called and eventually the constructor of dml.psql.class.inc is called with an empty \$args['dbname'].

In _getDBMSEngineByServer (previously _getDBMSEngineByHost) \$dbname_array and \$switch_dbnames are present but not passed.

But no dbname (or schema) is actually needed in this case.
