Yes, of course, that explains why the problem with the missing \$schema went away. I've replaced \$dbhost by \$server in the check and corrected another bug (see enclosed patch) and now the behaviour is as before: when importing databases, `_loadDatabases()` is called and eventually the constructor of `dml.psql.class.inc` is called with an empty `$args['dbname']`.

In `_getDBMSEngineByServer` (previously `_getDBMSEngineByHost`) `$dbname_array` and `$switch_dbnames` are present but not passed.

But no `dbname` (or `schema`) is actually needed in this case.
