Hi Tony,

after a popup call in a upd1 pattern the key values are changed. I want to insert the key values from the popup form as a foreign key. In the `_cm_popupReturn` function the key values in the `$fieldarray` as well as the values in the `$select_array` are fine. In my debugger I see that when returning the values from `_cm_getForeignData` in `std.table.class.inc` the key values are changed. Is it because I have the same names as key fields?

I attached the two dict files in the attachment in one file.
