I can access the application again when disabling directing http to https in the web hosting configuration. Then I have access via http.

When activating this button and setting `$GLOBALS['https_server'] = 'www.htmanager.de'` (which has the same name as the http server) I can open the login site. If I want to login I get an error message: redirection error. The request can't be finished.

Do I have to change something else i.e. `$GLOBALS['https_server_suffix']`?
