In line 1745 of std.pdf.class.inc there is the code: \$after2 =  
\$dbobject->\_cm\_ListView\_print\_after(\$current\_row, \$next\_row);

In my custom method \_cm\_ListView\_print\_after() is \$current\_row an array with the values of the last record. \$next\_row isn't an array. It is a boolean variable with value false.

Do I have to change \$next\_row in \_cm\_ListView\_print\_after()? And if yes, how can I do this?  
Because the return value is \$output.
