It sounds like you want to make use of the account_id column on the MNU-USER table which is described in [menuguide/mnu_user\(upd1\).html](#)

You do not need to copy any classes. If you read Implementing Virtual Private Databases you will see that all you need do is add the rdcaccount_id column to the relevant database tables in your application.

A user with a NULL value for account_id will be able to create and amend users for any account. Any other user will only be able to create and amend users with the same account_id.
