Notice that the documentation on deleteRecord (<http://www.tonymarston.net/php-mysql/functions-and-variables.html#notes.deleteRecord>) is not in sync with the source code any longer. This is the current description:

```
$rowdata = $object->deleteRecord ($rowdata)
```

\$rowdata (IN) is an associative array containing the details of a single database occurrence.

\$rowdata (OUT) is the same array.

The steps in this operation are as follows: Call `isPkeyComplete` to verify that a single record has been selected via its primary key. Call `_cm_pre_deleteRecord` to perform any custom pre-processing. Call `deleteRelations()` to delete any child relations. Call `_dml_deleteRecord()` to update the database. Call `_cm_post_deleteRecord` to perform any custom post-processing.

`$this->errors` will contain any error messages.

Note that the deletion may have been verified beforehand by a call to `validateDelete()`.

If we apply a consistent standard as in <http://www.tonymarston.net/php-mysql/functions-and-variables.html#notes.updateRecord>,

would like to propose to update this to:

```
$rowdata = $object->deleteRecord ($rowdata)
```

\$rowdata (IN) is an associative array containing the details of a single database occurrence.

\$rowdata (OUT) is the same array.

The steps in this operation are as follows: Call `_cm_pre_deleteRecord` to perform any custom pre-processing. Call `isPkeyComplete` to verify that a single record has been selected via its primary key. Call `_dml_readbeforeupdate()` to re-read the original database record. Call `_cm_validateDelete` to perform any custom validation. Call `deleteRelations()` to delete any child relations. Call `_dml_deleteRecord()` to update the database. Call `_cm_post_deleteRecord` to perform any custom post-processing.

`$this->errors` will contain any error messages.

Thanks for spotting that. I will update the documentation immediately if not sooner.
