This version adds a start and end date to user roles so that they can be phased in or out over time. It also updates the OUTPUT4 pattern to allow columns to be sequenced in a user-definable order and to be given user-definable labels. There are also some minor bug fixes.

Database changes:
run script menu\sql\mysql\alter_table(2017-07-20).sql in order to change the structure of the MENU databaserun script menu\sql\mysql\menu.menu_export(2017-07-20).sql in order to change the contents of the MENU database.
Other changes:
updated MNU_USER_ROLE table to include start_date and end_date so that roles can be activated or deactivated on certain dates.updated OUTPUT4 task so that the screen now shows a sequence number and a label for each column which can be exported to the CSV file. ***** NOTE THAT YOU WILL HAVE TO REBUILD EACH OUTPUT4 SCREEN STRUCTURE FILE USING THE TEMPLATE SCRIPT IN DEFAULT/SCREENS/EN/OUTPUT4.SCREEN.INC, NOT FORGETTING TO REPLACE '#tablename#' WITH THE ACTUAL TABLE NAME. *****fixed bug which prevented "where dt between curdate() and curdate() + interval 365 day" from working.fixed bug in 'std.add4.inc' where the call to getInitialDataMultiple() was using $where_array instead of the $where string.updated 'std.validation.class.inc' to reject any value for a primary or candidate keys which contains whitespace characters.fixed bug in 'getLanguageArray()' and 'getLanguageText()' so that they do not read in the the message file more times than is necessary.
