This version contains a few bug fixes and minor enhancements.

Database changes:
- run script menu\sql\mysql\menu.menu_export(2017-11-10).sql to update the contents of the MENU database

Other changes:
fixed bug in mnu_saved_selection.class.inc and output4_header.class.inc by renaming method updateSelection() to updateSavedSelection() so that it does not conflict with standard method inside std.table.class.inc
updated all dml.???.class.inc files and error.inc to cater for the $errcontext argument of the error handler being deprecated in PHP 7.2
updated _cm_getNodeData() in 'std.table.class.inc' to include a 4th argument called $collapsed.
updated 'std.tree_view1.inc' and 'std.tree_view2.inc' to maintain the contents of $collapsed.
updated return_bytes() function to split off the trailing alpha character before performing any multiplications.
updated the MENU database to include a new task called 'dates(all)' which will remove the 'dates(current/historic/future)' setting.
updated 'include.library.inc' so that the currentOrHistoric() function can deal with the 'dates(all)' option.
updated method '_cm_updateFieldarray()' method in 'std.table.class.inc' so that the 2nd argument is passed by reference. The contents of this array will automatically be merged with $fieldarray after the call so this provides the opportunity to remove values which are no longer wanted.
added array variable $no_filter_where to 'std.table.class.inc' which prevents column names which do not exist in the current table from being filtered out of the where string. This can be set in the '_cm_initialise()' method. This provides an alternative to the '_cm_filterWhere()' method.
updated 'include.xml.php5.inc' and 'std.data_field.xsl' to allow tooltips in custom buttons.
updated 'std.search1.inc' so that it calls the $dbobject->post_search() method before it saves the search string in the $_SESSION array instead of after.
updated 'std.filedownload.inc' so that you can provide the contents in memory instead of always having to read it from disk.
updated 'std.table.class.inc' so that the getData_raw() method saves its results in $this->fieldarray.
updated 'std.table.class.inc' so that the popupReturn() method will not call _cm_popupReturn() if the $selection argument is empty.
updated 'std.table.class.inc' by adding a 2nd argument to the sqlSelectInit() method which will optionally allow $this->lookup_data to be initialised.
updated 'include.session.inc' to improve the CSRF checks.
updated 'std.validation.class.inc' to improve the validation of boolean fields.
updated 'include.library.inc' so that the getForeignKeyValues() function can find the keys to either the parent or the child table in any parent-to-child relationship.

The new download zip file contains the following 3 files in a corrupted state:

css/default/refineButton_bg.jpg
images/sample-background.jpg
images/sample-logo.jpg

Kindly update them from the previous one. The attachment has these correct files.
