Hi Tony,
after a popup call in a upd1 pattern the key values are changed. I want to insert the key values from the popup form as a foreign key. In the `_cm_popupReturn` function the key values in the `$fieldarray` as well as the values in the `$select_array` are fine. In my debugger I see that when returning the values from `_cm_getForeignData` in `std.table.class.inc` the key values are changed. Is it because I have the same names as key fields?
I attached the two dict files in the attachment in one file.

When you return from a popup the default behaviour is for the column values in `$select_array` to be inserted into `$fieldarray`. This will cause the values for existing fields in `$fieldarray` to be overwritten regardless of whether they are part of the primary key, a candidate key or just foreign keys. If the fields being returned have one name, but you want to change them to another then you should do so in the `_cm_popupReturn()` method.

The `_cm_getForeignData()` method is designed to perform lookups on foreign key fields in order to retrieve additional data.

Now I understand and it works fine. The only thing I had to do was to change the values in `$select_array` into the original values (from `$fieldarray`) before returning `$fieldarray` at the end of the `_cm_popupReturn()` method. Thank you.

It's easy when you know how :)
