Hi Toni,

I have a list view report and I want to order the records alphabetical. In the `_cm_post_fetchRow($fieldarray)` method I get all the records in a different order.

In `functions-and-variables.html` I read that the `getData_serial($where)` methods gets all the records from the database. Afterwards they will be passed to the `_cm_post_fetchRow()` method one after the other.

In which `_cm_...` method can I see or change the order of the records or call the `getData_serial($where)` method?

You must set `$this->sql_orderby` BEFORE the call to `getData_serial`, which will merely issue the SELECT query *without* returning any data, just a resource. Calls to `$this->fetchRow()` will then return one record at a time from that resource.

Thank you. I placed the code in `_cm_pre_getData()` and everything works fine now.
