Hi Toni,
I have a list view report and I want to order the records alphabetical. In the _cm_post_fetchRow(\$fieldarray) method I get all the records in a different order. In functions-and-variables.html I read that the getData_serial(\$where) methods gets all the records from the database. Afterwards they will be passed to the _cm_post_fetchRow() method one after the other.
In which _cm_... method can I see or change the order of the records or call the getData_serial(\$where) method?

You must set \$this->sql_orderby BEFORE the call to getData_serial, which will merely issue the SELECT query *without* returning any data, just a resource. Calls to \$this->fetchRow() will then return one record at a time from that resource.

Thank you. I placed the code in _cm_pre_getData() and everything works fine now.
