I installed radicore with success on my Mac, but after uploading it to a server I can get it running, but two different users can't be logged at the same time.
If I log in with one user, the second users gets kicked off the system.
(I'm testing it with two different browsers, one for each user).

Any ideas of what can be the cause?

What is the setting for 'session.gc_maxlifetime' in your PHP.INI file? As each session closes this value is used to perform garbage collection, so any session entries which have a last_updated date older than this will be automatically deleted.

It's 1440, should I change it?

I increased the value to 3600 but still the same problem.

You need to step through with your debugger to see what is happening when the close() method within file php_session.class.inc is called. That is the one which is calling the gc() method for garbage collection.
