Let's see what answers I will get from my ISP's support team. This may take a little time.

Discussing about an ISPs qualities won't get us anywhere. I would prefer a pragmatic approach, and see what possiblities there are for me to get the framework running.

I have come across the following under RADICORE programming guidelines:

11. It may be a good idea to include a prefix on each table name which helps identify the database. For example, in my MENU database all tables are prefixed with "mnu_". This will be of use in those situations where there is a restriction on the number of different databases which can be created, in which case you have no alternative but to merge all the tables into a single database. If two different tables have the same name you immediately have a big problem. Having a prefix will circumvent this problem.

This describes exactly my situation. Is this statement no longer valid?
