The default SELECT statement created by Radicore should be as follows:

```
SELECT instruments.*  
FROM instruments  
LEFT JOIN instrument_models ON (instrument_models.instrument_model_id =  
instruments.instrument_model_id)
```

You need to extend this in your `_cm_pre_getdata()` method (as shown in <http://www.tonymarston.net/php-mysql/infrastructure-faq.html#faq84>) so that it becomes as follows:

```
SELECT instruments.*, CONCAT (instrument_type_name, ' - ',  
                             instrument_model_manufacturer, '  
                             instrument_model_name) AS instrument_model  
FROM instruments  
LEFT JOIN instrument_models ON (instrument_models.instrument_model_id =  
instruments.instrument_model_id)  
LEFT JOIN instrument_types ON (instrument_type.instrument_type_id =  
instrument_models.instrument_type_id)
```
