The problem lies in the line

$array[1]['class'] = 'Default_Table'

This should be reporting 'dict_table_s02' instead, which is the name of the current class.

'dict_table_s02' extends 'dict_table' which extends 'Default_Table'.

It is 'dict_table_s02' which is being accessed from 'std.update4.inc', so neither 'dict_table' nor 'Default_Table' should appear in this array at all.

Which version of PHP are you running? Are you using Zend Accelerator?
