If you are running PHP5 can you do 'print\_r(\$array)' just after the call to debug\_backtrace. There should be an entry which reads  
[object] => dict\_table\_s02 Object

This should then be detected with the lines

```
if (is_a($array[$i]['object'], $classname)) {  
    $method = $array[$i]['function'];  
    break;  
} // if
```
