I've had a play with this and changed the getInitialDataMultiple() method so that it outputs a multi-dimensional array (indexed by row number, then associative for each row) instead of an associative array for a single row only. This will be released in version 1.30.0 which will be available shortly.

In the meantime you can try this code - in the getInitialDataMultiple() method of std.table.class.inc change this:

```
if (!empty($where)) {  
    if (is_array($where)) {  
        $fieldarray = $where;  
    } else {  
        // convert 'where' string to an associative array  
        $fieldarray = where2array($where);  
    } // if  
} else {  
    $fieldarray = array();  
} // if
```

to this:

```
if (!empty($where)) {  
    if (is_array($where)) {  
        $fieldarray = $where;  
    } else {  
        // convert 'where' string to an array which is indexed by row number  
        $array1 = splitWhereByRow($where);  
        // convert 'where' for each row into an associative array  
        foreach ($array1 as $rownum => $rowdata) {  
            $fieldarray[] = where2array($rowdata);  
        } // foreach  
    } // if  
} else {  
    $fieldarray = array();  
} // if
```

Let me know if this solves your problem.
