If you put anything into $this->errors then the update is deemed to have failed, in which a rollback will automatically be performed. If you want to issue a message which is not an error then use $this->messages instead.

If you want to prevent the insert of a duplicate record for a person then doing it in the _cm_post_insertRecord() method is too late as that is performed AFTER the insert. You should use the _cm_validateInsert() method which is performed BEFORE the insert. If you discover that the record is a duplicate then return an empty array - this will cause the INSERT to be skipped, but the original data will still be available in the _cm_post_insertRecord() method so that you can update the pers_school_xref table.
