If you put anything into `$this->errors` then the update is deemed to have failed, in which a rollback will automatically be performed. If you want to issue a message which is not an error then use `$this->messages` instead.

If you want to prevent the insert of a duplicate record for a person then doing it in the `_cm_post_insertRecord()` method is too late as that is performed AFTER the insert. You should use the `_cm_validateInsert()` method which is performed BEFORE the insert. If you discover that the record is a duplicate then return an empty array - this will cause the INSERT to be skipped, but the original data will still be available in the `_cm_post_insertRecord()` method so that you can update the `pers_school_xref` table.
