Okay I'm thinking that maybe the issue arises from the fact that what I'm trying to do with the virtual table and what you do in your example aren't exactly the same.

What I'm reading in the example when you call $this->getScrollItem($this->pageno)
It returns information on a single record.

For what I'm trying to do. There can be 0-N children. So whats happening is I'm getting N pages with 1 record each instead of N/rowsPerPage pages with rowsPerPage records on it.

Is there a built in function getScrollSet($pageno) that returns what I need??
