Subject: Error after upgrade to 1.37

Hi,
After upgrading to 1.37 my application fails. I'm getting:
Column 'xxx' cannot be null (# 1048).

I call updateRecord, column (type integer) mentioned in the error message currently has a value of 2, new value is 0.

I tracked the error down to method updateRecord in Class mysql (file dml.mysqli.class.inc). Error occurs because a new if statement was introduced in this method:

```
...
} elseif (preg_match($pattern, $fieldspec[$item]['type'], $match)) {

 if (empty($value) {
  $update .= "$item=NULL,";
 }
 ...
```

Since a value of 0 is considered as empty in PHP the value of the column is set to NULL which, in my case, is not valid.
