In fact it does make a difference only in one screen: when the user selects more than one record for deletion:

I have a table `persons` and then a table `part_ent_xref` that links the person to the users 'entidad_id' (`$entidad_id[0]['entidad_id']`).

The where clause is modified so the user can only see the persons that are linked to him.

When the user selects several persons for deletion and presses the submit button, I'm not deleting the record from `persons` but from `part_ent_xref`, so if for example the original \$where is:

```
participante_id=1 OR participante_id=4 OR participante_id=6 AND participante_id IN (SELECT
participante_id FROM part_ent_xref WHERE entidad_id=7)
```

If I select the three persons and click on delete, and delete the record in `part_ent_xref` where `participante_id=1`, on the del1 screen the person with `participante_id=1` still shows up.

I tried the where clause with parenthesis and then it doesn't show up.

(If I didn't explain myself I can give you the login details so you can check yourself)
