Subject: can't have a database table called 'class'

This problem seems pretty obvious in hindsight, but I created a table called "class", which causes Radicore to generate a class file with the name "class" -- a syntax error.

I would suggest adding some sort of check for table names that won't translate to PHP classes, when they are first imported into the dictionary. Or, rather than making a list of words that are reserved, it might be easier to just run "php -l" on each generated file.

I don't mind correcting my own naming errors (to fix my problem, I'm renaming "class" to "course"); my concern is that the Radicore application generates PHP scripts that don't parse.
