Thanks Tony, I've tried this now.

It half solves the problem. If the user is logged in then they will see the shutdown times in the correct timezone if it is within the warning period. However, once the system is shutdown, they are be definition logged out, so the system displays the time the system is available again using the default server timezone. Not sure what the solution to this might be!

Similarly, if the user is logged out (e.g. coming to the login screen for the first time, or at the login screen having just logged out) and the time is within the warning period, then the times will not be in the relevant timezone. An easy get out solution to this is not to display the warning messages on these types of screens (login, password reminder etc), although I think that would be a shame.

Maybe you have a proper solution?
