I think the reason may be at lines 24 - 28 in std_update1.inc:

```
if (!empty($selection) AND !isset($return_from)) {  
    // $selection takes precedence over $where  
    $where    = $selection;  
    $selection = null;  
} // if
```

This explains what I was seeing in the debugger rather than what is described in some of the documentation.
