It is the default behaviour to replace \$where with \$selection when \$selection is not empty. In order to override this default you should place the following code in the outer/parent table of the MULTI2 task:

```
function _cm_initialise ($where, &$selection, $search)
// perform any initialisation for the current task.
// NOTE: $selection is passed by reference as it may be amended.
// NOTE: $search is only available for OUTPUT tasks.
{
    $selection = null;

    return $where;

} // _cm_initialise
```

This will then prevent \$where from being replaced with the contents of \$selection.
