I have played around with some test data in the EXAMPLE subsystem to see if I can achieve the result you desire. The only way I could do this was to modify the _cm_ListView_print_after() method to include a second argument for \$next_row. My 'before' and 'after' methods are as follows:

```
function _cm_ListView_print_before ($prev_row, $curr_row)
// allow extra rows to be created in List View
  $output = array();
  if (!empty($prev_row)) {
    // row has changed
    if (substr($prev_row['last_name'], 0, 1) != substr($curr_row['last_name'], 0, 1)) {
      // first character of last name has changed
    $this->pdf->AddPage();
    } // if
  } // if
  return $output;
} // _cm_ListView_print_before
function cm ListView print after ($curr row, $next row)
// allow extra rows to be created in List View
  $output = array();
  if (substr($next_row['last_name'], 0, 1) != substr($curr_row['last_name'], 0, 1)) {
    // first character of last name has changed
    $output[0]['pers type desc'] = 'after' .$curr row['person id'];
  } // if
  return $output;
} // cm ListView print after
```

Attached are the framework scripts which I have modified. Try them out and let me know if they solve your problem.
