Here's a better implementation which does not involve changing the standard classes, so any customisations which you make will not get overwritten in a future release.

I have created a new directory called 'workflow/classes/custom-processing' which contains a file called 'example.zip'. This zip file contains some examples of how the standard classes can be customised. These custom classes have a prefix of 'cp\_' so that they can be separated from the standard classes.

If you do not have any custom processing then do not place any class files in the 'custom-processing' directory.

I have modified the standard 'wf\_workitem\_role' and 'wf\_workitem\_user' classes so that when the '\_cm\_post\_getData()' method is executed it will look in the 'custom-processing' directory for a 'cp\_' class file. If one exists it will execute whatever code it finds in the '\_cm\_post\_getData()' method. If a file cannot be found then the database data will not be altered.
