I have played around with the 'workitem(timeout).php' script after creating a few timed events using different values of 'rdcaccount_id'. In order to make it work properly I have changed it so that it reads the contents of the MNU_ACCOUNT table, then for each rdcaccount_id it looks for corresponding records on the WF_WORKITEM table which need processing.

This means that this single batch job will be able to process outstanding workitems for all accounts, thus removing the need for a separate batch job for each account.
