Subject: NULL string

Hi Mr. Marston,

these are two "stupid" questions for a professional programmer but, for an end-user like me (that like your works and applied it to a 'database' [ex Microsoft Access] to archiving my music library) are a little bit confusing:

1. I have a situation where, in some cases, last_name can be NULL so, when I'm trying to execute an \$sql_select that have:

```
CONCAT(first_name, " ",last_name) the result (obviously) is NULL.
```

Can I (and how) implement the control for this situation. I think the better place is in .class.inc with _cm_formatData :

2. Is it possible with filepicker to access <subdirectories> of the <main> (picture) in you example?

Thank you in advance Maurizio Galdiolo
