The valid routing combinations are shown in http://www.tonymarston.net/php-mysql/workflow.html#routing, and working examples of these combinations are included in the Radicore download. These are documented in http://www.radicore.org/demo/workflow/docs/workflow-examples .html

After you build a workflow you must validate it before it can be used, and the error messages should be self explanatory.

The workflow shown in your diagram loops back on itself, so I suggest try to model it on Example 5 iterative routing.
