The first thing that I notice is that you have an invalid column name. `ver eine_kuerzel` contains a space, which is not valid SQL. Although MySQL will allow it if the column name is always enclosed in backticks, the Radicore framework does not always use backticks.

I have created a test subsystem called 'vpd' (for Virtual Private Directory) which I use to test this feature, and that contains a LIST2 which works as expected. Perhaps you can try installing this to see if there is any difference with your implementation.
