I installed VPD and I think everything works fine. If I log in with different rdcaccount_id's I see different values for x_person, x_pers_type, x_option and x_tree_type.

I also checked the correct spelling of 'vereine_kuerzel' in the database and in the dictionary of Radicore.

Could it be that the primary key exists of too many fields?

I will examine your table structures and see if I did something wrong.
