Thanks. According to the workflow, after finishing this 'add_person' task, the task of person_addr_add should run. But this task don't run. the code of person_addr_add.php below:

```
-----  
-----  
<?php  
  
$stdout = '../logs/x_person_addr.html';  
$csvout = '../logs/x_person_addr.csv';  
ini_set('include_path', '.');  
require 'std.batch.inc';  
  
batchInit(__FILE__);  
$table_id = 'x_person_addr'; // table name  
$task_id = basename($task_id, '.php'); // replaces 'batch'  
$role_id = 'DEMO'; // replaces 'batch'  
  
$filename = 'E:\xampp\htdocs\files\upload\addr.csv';  
  
$dbobject = RDCsingleton::getInstance('x_person_addr');  
  
// do not fail if record already exists when inserting  
$dbobject->no_duplicate_error = TRUE;  
  
require('std.csv.class.inc');  
$CSVobj = new csv_class($dbobject);  
  
// read first line to obtain delimiter (comma, tab or pipe)  
$CSVobj->open_read($filename);  
check_errors($CSVobj);  
  
$count = 0;  
while ($data = $CSVobj->read_file()) {  
    // give this array to the database object  
    $dbobject->startTransaction();  
    print('*****');  
    print_r($data);  
    print('*****');  
    $data = $dbobject->insertRecord($data);  
    check_errors($dbobject);  
    $dbobject->commit();  
    $count ++;  
  
    if (!$result = fwrite($stdout, $output)) {
```

```
        trigger_error("Cannot write to file $stdout", E_USER_ERROR);
    } // if
    $output = "";
} // while
check_errors($CSVobj);
```

```
$output = "<p>$count records processed.<p>";
if (!$result = fwrite($stdout, $output)) {
    trigger_error("Cannot write to file $stdout", E_USER_ERROR);
} // if
```

```
fclose($handle);
```

```
batchEnd();
```

```
?>
```

the addr.csv file is:

```
person_id,address_no,addr_line_1,town,postcode
test_100,tst100addr,hahaStreet,London,EH1 4AS
```

the person.csv file is:

```
person_id,nat_ins_no,pers_type_id,node_id,star_sign
test_100,tes100,test10,2,CAN
```
