By default the popup form will only return the primary key of the selected entry. There ate two ways to obtain other (non-key) values:
(1) Use the _cm_getPkeyNames() method in the popup form to add extra field names to the list of primary key fields.
(2) After returning to the form which called the popup you may insert code to read the record with that primary key. This will give you access to all the data on the selected record. You can put code in the _cm_popupReturn() method or the _cm_post_popupReturn() method.
