
Subject: problem with updateRecord()

I have the following code in the `_cm_post_insertRecord()` function. I want to change values in a parent table after inserting an additional occurrence in the child table. But the values aren't updated with `$dbobject->updateRecord ($data)`;

```
function _cm_post_insertRecord ($rowdata)
// perform custom processing before database record is inserted.
// if anything is placed in $this->errors the insert will be terminated.
{
    // verfügbare (+1), belegte (+1) und freie Plätze (-1) werden aktualisiert
    // get contents of foreign table SPIELE_TRANSPORT
    $dbobject =& RDCsingleton::getInstance('spiele_transport'); // Instanz für Lookup-Tabelle
    $where = "verbaende_art_id='{ $rowdata['verbaende_art_id']}' AND
    verbaende_kuerzel='{ $rowdata['verbaende_kuerzel']}' AND
    vereine_kuerzel='{ $rowdata['vereine_kuerzel']}' AND
    saison_id='{ $rowdata['saison_id']}' AND
    mannschaften_id='{ $rowdata['mannschaften_id']}' AND
    spiel_seq_no='{ $rowdata['spiel_seq_no']}' AND
    transport_no='{ $rowdata['transport_no']}";

    $data = $dbobject->getData ($where);

    if (!empty($data)){
        $data = $data[0];
        $data['transport_plaetze_belegt'] += 1;
        $data['transport_plaetze_frei'] -= 1;
        $dbobject->updateRecord ($data);
    } // if

    return $rowdata;

} // _cm_post_insertRecord
```

I know that in the `std.tbl.class.inc` the function `updateRecord()` comes with `$fieldarray`. But I don't know how to handle it.

What is wrong with my code?

Many Thanks in advance.
