Sorry, but I didn't succeed.

(1) I looked at your example in option_list(a).php and changed my $sql_select statement as discribed below:

$sql_select = 'CONCAT(vereine_kuerzel, \' \', mannschaften_id) AS mannschaft_name';

In the report I changed the entry in:

$structure['title'][] = array('text' => '%%mannschaft_name', 'width' => 15, 'align' => 'left', 'x' => 25, 'y' => 0);

But there is no output. What did I wrong?

(2) Can I get a field value of the parent table within the above sql_select statement? I want to show a logo image file in the child report title. But the file name is stored in the parent table. I think that this should work with outer/inner join in a way as you showed in option_list(a).php. Did you somewhere describe this problems in one of your documentation? Or can you tell me what SQL-expression I should looking for to get information how to handle it?

Once more, thanks for your patience!
