Subject: add1 in shared account

Hello Tony,

is it possible to insert records from a normal account in a shared account?

I have a contact-pool table where all new inserted records should be available for everyone. I want to do this by changing the key values in $fieldarray[] (user_id, user_seq_no, rdcaccount_id) in the _cm_getInitialData() method in the class file.

```
   function _cm_getInitialData ($fieldarray)
   {
// get next available number for user_seq_no for user HTM
$where = "user_id='HTM'";
$query = "SELECT max(user_seq_no) FROM $this->tablename WHERE $where";
$count = $this->getCount($query);
$fieldarray['user_id'] = 'HTM';
$fieldarray['user_seq_no']  = $count + 1;
$fieldarray['rdcaccount_id'] = '1';

    return $fieldarray;

   } // _cm_getInitialData
```

But when pressing the New button I get the following error message: [rdcaccount_id] User's account (4) is not compatible with record's account (1)
When commenting out $fieldarray['rdcaccount_id'] the add1 task works fine with the next available user_seq_no for user HTM but with rdcaccount=(4).

So is there a possibility to realize that?
