When you enter the _cm_pre_deleteRecord method the $rowdata argument contains values from the database record which is the subject of this deletion. I see from this code that it has the name $rowdata['file'] which you are then copying into the $filename variable along with the directory name. You are then doing something with a 'training_plan_uebungen' object, but I cannot determine what. You need to step through with your debugger to see where the actual behaviour differs from what you are expecting.
