There are several ways in which this can be done.

1) If you go to the Data Dictionary and look at either "Add Child Relationship" or "Add Parent Relationship" you will see that on the left is a dropdown list which enables you to select the database, and on the right is a popup button which will show you the tables which exist within that database.

2) You could use a POPUP2 pattern with category as the outer/top entity and exercise as the inner/bottom entity. If you are unable to pass the identity of the category to this popup then take a look at option #2 in FAQ7 which will show you how you can call a POPUP1 pattern to select the outer entity before the POPUP2 screen is displayed.

3) There is always AJAX, but I do not provide any facilities for this in RADICORE.
