I think the only way to realize this is the second way you proposed. I think I understand the way to do this, too. I read the option #2 in FAQ79. But I have problems to find the right way.

I created a PopUp1 for table category. I created a PopUp2 for the (link) table. I inserted the following code (as shown in #2 of FAQ79) in the class of the PopUp2 (link) table.

If I call the PopUp2 function I get a white screen telling me that the website can never finish the query.

Where is my fault?

```
function _cm_initialise ($where)
// perform any initialisation for the current task.
{
   if (empty($where)) {
    if (isset($GLOBALS['return_from'])) {
    if ($GLOBALS['return_from'] == 'htm_training_plan_uebungskategorie(popup1)') {
      // nothing selected from popup screen
      $this->scriptPrevious($GLOBALS['errors']);
      } // if
     } // if

     $pattern_id = getPatternId();
     if (strtolower($pattern_id) == 'popup2') {
        // request_id has not been supplied yet, so get it now via a popup
      $this->scriptNext('htm_training_plan_uebungen_kategorie(popup2)');
     } // if
    } // if
    return $where;

} // _cm_initialise
```
